Coding Problem

Triplets

21-Feb-2022

Given an array containing N Integers, and an number S denoting a target sum.

Find all distinct integers that can add up to form target sum. The numbers in each triplet should be ordered ~~too~~ ordered in ascending order, and triplets should be ordered too.

Return empty array if no such triplet exists.

Lets try to understand problem with example.

arr = [1, 2, 3, 4, 5, 6, 7, 8, 9, 15]

target = 18

[[1, 2, 15], [1, 8, 9], [2, 7, 9], [3, 6, 9], [4, 5, 9], [3, 7, 8] [4, 6, 8), [5, 6, 7)]

→ so Code is completed and uploaded in github.
